

# A Shooting Star

They Might be Giants

A shooting star is not a star  
is not a star at all  
A shooting star's a meteor  
that's heading for a fall

A shooting star is not a star  
why does it shine so bright?  
The friction as it falls through air  
produces heat and light

A shooting star or meteor  
whichever name you like,  
the minute it comes down to earth  
it's called a meteorite.
